

Locked-model external validation, arm-matched design 4 evaluations attempted; the 3 that can be scored

TransNEO genomic (DHP model): NOT VALIDABLE — 3 of the 4 signature features are not measured in that cohort (DNA_HRD, DNA_NCOR1_CNA, DNA_COSMIC.Signature.2).

Every row applies the locked signature, classifier and hyper-parameters, fitted once on the corresponding PREDIX arm cohort. No feature selection, no tuning, no cross-validation of the model. The internal comparator is measured on the PREDIX complete-case evaluation cohort (59 DHP, 51 T-DM1), a different population from the external one. Features are standardised within each cohort by z-score. P is a one-sided bootstrap tail probability against chance; its resolution floor over 2000 draws is about 0.0005, so rows at the floor are shown as an inequality.
